# 矩阵求导

张腾

2022年7月2日

标量、向量、矩阵间的求导共有9种可能:

∂标量/∂标量	∂标量/∂向量	∂标量/∂矩阵
∂向量/∂标量	∂向量/∂向量	∂向量/∂矩阵
∂矩阵/∂标量	∂矩阵/∂向量	∂矩阵/∂矩阵

表 1: 9 种求导情形

∂标量/∂标量就是我们熟悉的单变量微积分, ∂向量/∂矩阵、∂矩阵/∂向量、∂矩阵/∂矩阵会涉及高 阶张量,处理更为麻烦,因此本文只考虑剩下的 5 种情形。

设  $u \in \mathbb{R}^l$ ,  $\mathbf{U} \in \mathbb{R}^{m \times n}$ , 则向量、矩阵对标量求导的定义为

$$\frac{\partial \boldsymbol{u}}{\partial x} \triangleq \begin{bmatrix} \frac{\partial u_1}{\partial x} \\ \frac{\partial u_2}{\partial x} \\ \vdots \\ \frac{\partial u_l}{\partial x} \end{bmatrix}, \quad \frac{\partial \mathbf{U}}{\partial x} \triangleq \begin{bmatrix} \frac{\partial u_{11}}{\partial x} & \frac{\partial u_{12}}{\partial x} & \cdots & \frac{\partial u_{1n}}{\partial x} \\ \frac{\partial u_{21}}{\partial x} & \frac{\partial u_{22}}{\partial x} & \cdots & \frac{\partial u_{2n}}{\partial x} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial u_{m1}}{\partial x} & \frac{\partial u_{m2}}{\partial x} & \cdots & \frac{\partial u_{mn}}{\partial x} \end{bmatrix}$$

设  $x \in \mathbb{R}^l$ ,  $\mathbf{X} \in \mathbb{R}^{m \times n}$ , 则标量对向量、矩阵求导的定义为

$$\frac{\partial u}{\partial x} \triangleq \begin{bmatrix} \frac{\partial u}{\partial x_1} & \frac{\partial u}{\partial x_2} & \cdots & \frac{\partial u}{\partial x_l} \end{bmatrix}, \quad \frac{\partial u}{\partial \mathbf{X}} \triangleq \begin{bmatrix} \frac{\partial u}{\partial x_{11}} & \frac{\partial u}{\partial x_{21}} & \cdots & \frac{\partial u}{\partial x_{m1}} \\ \frac{\partial u}{\partial x_{12}} & \frac{\partial u}{\partial x_{22}} & \cdots & \frac{\partial u}{\partial x_{m2}} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial u}{\partial x_{1n}} & \frac{\partial u}{\partial x_{2n}} & \cdots & \frac{\partial u}{\partial x_{mn}} \end{bmatrix}$$

即向量、矩阵对标量求导的结果与分子尺寸相同,标量对向量、矩阵求导的结果与分母的转置尺寸相同。向量对向量求导的定义为雅可比矩阵:

$$\frac{\partial \boldsymbol{u}}{\partial \boldsymbol{x}} \triangleq \begin{bmatrix} \frac{\partial u_1}{\partial x_1} & \frac{\partial u_1}{\partial x_2} & \cdots & \frac{\partial u_1}{\partial x_l} \\ \frac{\partial u_2}{\partial x_1} & \frac{\partial u_2}{\partial x_2} & \cdots & \frac{\partial u_2}{\partial x_l} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial u_l}{\partial x_1} & \frac{\partial u_l}{\partial x_2} & \cdots & \frac{\partial u_l}{\partial x_l} \end{bmatrix}$$

即行数与分子尺寸相同、列数与分母尺寸相同。

以上即为分子布局, 其好处是链式法则跟单变量微积分中的顺序一样, 坏处是计算标量值函数 f(x) 关于向量变量 x 的梯度时要多做一个转置:  $\nabla f = (\partial f/\partial x)^{\top}$ , 否则梯度下降优化变量和梯度没法直接相减。分母布局的结果均是分子布局的转置, 好处就是算梯度时不用做转置, 坏处就是链式法则的顺序要完全反过来。

### 1 基本结果

以下结果根据定义和单变量微积分的求导法则都是显然的。 单变量微积分中常量的导数为零

$$\frac{\partial a}{\partial x} = 0$$

类似的这里有

$$\frac{\partial a}{\partial x} = 0$$
,  $\frac{\partial a}{\partial x} = 0^{\top}$ ,  $\frac{\partial a}{\partial x} = 0$ ,  $\frac{\partial A}{\partial x} = 0$ ,  $\frac{\partial a}{\partial x} = 0^{\top}$ 

单变量微积分中常数标量乘的求导法则为

$$\frac{\partial(au)}{\partial x} = a\frac{\partial u}{\partial x}$$

类似的这里有

$$\frac{\partial(a\mathbf{u})}{\partial x} = a\frac{\partial \mathbf{u}}{\partial x}, \quad \frac{\partial(a\mathbf{u})}{\partial x} = a\frac{\partial \mathbf{u}}{\partial x}$$

单变量微积分中加法的求导法则为

$$\frac{\partial(u+v)}{\partial x} = \frac{\partial u}{\partial x} + \frac{\partial v}{\partial x}$$

类似的这里有

$$\frac{\partial(\boldsymbol{u}+\boldsymbol{v})}{\partial x} = \frac{\partial \boldsymbol{u}}{\partial x} + \frac{\partial \boldsymbol{v}}{\partial x}, \quad \frac{\partial(\boldsymbol{u}+\boldsymbol{v})}{\partial x} = \frac{\partial \boldsymbol{u}}{\partial x} + \frac{\partial \boldsymbol{v}}{\partial x}, \quad \frac{\partial(\boldsymbol{u}+\boldsymbol{v})}{\partial x} = \frac{\partial \boldsymbol{u}}{\partial x} + \frac{\partial \boldsymbol{v}}{\partial x}$$
$$\frac{\partial(\boldsymbol{U}+\boldsymbol{V})}{\partial x} = \frac{\partial \boldsymbol{U}}{\partial x} + \frac{\partial \boldsymbol{V}}{\partial x}, \quad \frac{\partial(\boldsymbol{u}+\boldsymbol{v})}{\partial x} = \frac{\partial \boldsymbol{u}}{\partial x} + \frac{\partial \boldsymbol{v}}{\partial x}$$

单变量微积分中乘法的求导法则为

$$\frac{\partial(uv)}{\partial x} = \frac{\partial u}{\partial x}v + u\frac{\partial v}{\partial x}$$

类似的这里有

$$\frac{\partial(uv)}{\partial x} = \frac{\partial u}{\partial x}v + u\frac{\partial v}{\partial x}, \quad \frac{\partial(uv)}{\partial x} = \frac{\partial u}{\partial x}v + u\frac{\partial v}{\partial x}$$
$$\frac{\partial(\mathbf{UV})}{\partial x} = \frac{\partial \mathbf{U}}{\partial x}\mathbf{V} + \mathbf{U}\frac{\partial \mathbf{V}}{\partial x}, \quad \frac{\partial(uv)}{\partial \mathbf{X}} = \frac{\partial u}{\partial \mathbf{X}}v + u\frac{\partial v}{\partial \mathbf{X}}$$

其中第二行是因为

$$\begin{bmatrix} \frac{\partial (\mathbf{U}\mathbf{V})}{\partial x} \end{bmatrix}_{ij} = \frac{\partial (\sum_{k} u_{ik} v_{kj})}{\partial x} = \sum_{k} \frac{\partial u_{ik}}{\partial x} v_{kj} + \sum_{k} u_{ik} \frac{\partial v_{kj}}{\partial x} = \begin{bmatrix} \frac{\partial \mathbf{U}}{\partial x} \mathbf{V} \end{bmatrix}_{ij} + \begin{bmatrix} \mathbf{U} \frac{\partial \mathbf{V}}{\partial x} \end{bmatrix}_{ij} 
\begin{bmatrix} \frac{\partial (uv)}{\partial \mathbf{X}} \end{bmatrix}_{ij} = \frac{\partial (uv)}{\partial x_{ji}} = \frac{\partial u}{\partial x_{ji}} v + u \frac{\partial v}{\partial x_{ji}} = \begin{bmatrix} \frac{\partial u}{\partial \mathbf{X}} \end{bmatrix}_{ij} v + u \begin{bmatrix} \frac{\partial v}{\partial \mathbf{X}} \end{bmatrix}_{ij}$$

第一行可看作第二行的特例。 $\partial(uv)/\partial x$  有两种可能,一是 uv 为标量,即两者的内积,这里暂且不表,后文再讲;二是 uv 为矩阵,这属于我们不考虑的 $\partial$ 矩阵/ $\partial$ 向量情形。

单变量微积分中有  $\partial x/\partial x=1$ , 类似的这里有

$$\frac{\partial x_i}{\partial x} = e_i^{\top}, \quad \frac{\partial x}{\partial x_i} = e_i, \quad \frac{\partial x}{\partial x} = I, \quad \frac{\partial x_{ij}}{\partial X} = E_{ji}, \quad \frac{\partial X}{\partial x_{ij}} = E_{ij}$$

其中  $\mathbf{E}_{ij}$  是 (i,j) 处为 1 其余为 0 的矩阵。

单变量微积分中的链式法则为

$$\frac{\partial g(u)}{\partial x} = \frac{\partial g(u)}{\partial u} \frac{\partial u}{\partial x}$$

类似的,

• 只涉及向量:设  $x \in \mathbb{R}^n$ ,  $u = u(x) \in \mathbb{R}^m$ ,  $g: \mathbb{R}^m \mapsto \mathbb{R}^l$ , 则

$$\underbrace{rac{\partial oldsymbol{g}(oldsymbol{u})}{\partial oldsymbol{x}}}_{l imes oldsymbol{u}} = \underbrace{rac{\partial oldsymbol{g}(oldsymbol{u})}{\partial oldsymbol{u}}}_{l imes oldsymbol{u}} \underbrace{rac{\partial oldsymbol{u}}{\partial oldsymbol{x}}}_{m imes n}$$

这是因为

$$\begin{bmatrix} \frac{\partial \boldsymbol{g}(\boldsymbol{u})}{\partial \boldsymbol{x}} \end{bmatrix}_{ij} = \frac{\partial [\boldsymbol{g}(\boldsymbol{u})]_i}{\partial x_j} = \sum_{k \in [m]} \frac{\partial [\boldsymbol{g}(\boldsymbol{u})]_i}{\partial u_k} \frac{\partial u_k}{\partial x_j} = \frac{\partial [\boldsymbol{g}(\boldsymbol{u})]_i}{\partial \boldsymbol{u}} \frac{\partial \boldsymbol{u}}{\partial x_j} 
= \begin{bmatrix} \frac{\partial \boldsymbol{g}(\boldsymbol{u})}{\partial \boldsymbol{u}} \end{bmatrix}_{i,:} \begin{bmatrix} \frac{\partial \boldsymbol{u}}{\partial \boldsymbol{x}} \end{bmatrix}_{:,j} = \begin{bmatrix} \frac{\partial \boldsymbol{g}(\boldsymbol{u})}{\partial \boldsymbol{u}} \frac{\partial \boldsymbol{u}}{\partial x} \end{bmatrix}_{i,j}$$

注意若 n = m = l = 1,就退化成了单变量的链式法则。

• 自变量是矩阵: 设  $u = u(\mathbf{X}), g: \mathbb{R} \mapsto \mathbb{R}, 则$ 

$$\frac{\partial g(u)}{\partial \mathbf{X}} = \frac{\partial g(u)}{\partial u} \frac{\partial u}{\partial \mathbf{X}}$$

这是因为

$$\left[\frac{\partial g(u)}{\partial \mathbf{X}}\right]_{ij} = \frac{\partial g(u)}{\partial x_{ji}} = \frac{\partial g(u)}{\partial u} \frac{\partial u}{\partial x_{ji}} = \frac{\partial g(u)}{\partial u} \left[\frac{\partial u}{\partial \mathbf{X}}\right]_{ij}$$

• 中间变量是矩阵: 设  $\mathbf{U} = \mathbf{U}(x) \in \mathbb{R}^{m \times n}$ ,  $g: \mathbb{R}^{m \times n} \mapsto \mathbb{R}$ , 则

$$\frac{\partial g(\mathbf{U})}{\partial x} = \sum_{p} \sum_{q} \frac{\partial g(\mathbf{U})}{\partial u_{pq}} \frac{\partial u_{pq}}{\partial x} = \sum_{q} \sum_{p} \left[ \frac{\partial g(\mathbf{U})}{\partial \mathbf{U}} \right]_{qp} \left[ \frac{\partial \mathbf{U}}{\partial x} \right]_{pq} = \text{tr} \left( \frac{\partial g(\mathbf{U})}{\partial \mathbf{U}} \frac{\partial \mathbf{U}}{\partial x} \right)$$
(1)

# 2 向量对标量求导

矩阵和向量的乘积是向量, 若A与x无关, 易知有

$$\begin{bmatrix}
\frac{\partial(\mathbf{A}\boldsymbol{u})}{\partial x} \end{bmatrix}_{i} = \frac{\partial[\mathbf{A}\boldsymbol{u}]_{i}}{\partial x} = \frac{\partial(\sum_{k} a_{ik} u_{k})}{\partial x} = \sum_{k} a_{ik} \frac{\partial u_{k}}{\partial x} = \left[\mathbf{A} \frac{\partial \boldsymbol{u}}{\partial x}\right]_{i} \Longrightarrow \frac{\partial(\mathbf{A}\boldsymbol{u})}{\partial x} = \mathbf{A} \frac{\partial \boldsymbol{u}}{\partial x}$$

$$\frac{\partial(\boldsymbol{u}^{\top}\mathbf{A})}{\partial x} = \left[\frac{\partial(\mathbf{A}^{\top}\boldsymbol{u})}{\partial x}\right]^{\top} = \left[\mathbf{A}^{\top} \frac{\partial \boldsymbol{u}}{\partial x}\right]^{\top} = \frac{\partial \boldsymbol{u}^{\top}}{\partial x} \mathbf{A}$$

向量的外积也是向量,记  $u = [u_1(x); u_2(x); u_3(x)], v = [v_1(x); v_2(x); v_3(x)],$ 则

$$\mathbf{u} \times \mathbf{v} = \begin{bmatrix} u_2 v_3 - u_3 v_2 \\ u_3 v_1 - u_1 v_3 \\ u_1 v_2 - u_2 v_1 \end{bmatrix}$$

于是

$$\frac{\partial(\boldsymbol{u}\times\boldsymbol{v})}{\partial x} = \begin{bmatrix} \frac{\partial u_2}{\partial x}v_3 - \frac{\partial u_3}{\partial x}v_2 + u_2\frac{\partial v_3}{\partial x} - u_3\frac{\partial v_2}{\partial x} \\ \frac{\partial u_3}{\partial x}v_1 - \frac{\partial u_1}{\partial x}v_3 + u_3\frac{\partial v_1}{\partial x} - u_1\frac{\partial v_3}{\partial x} \\ \frac{\partial u_1}{\partial x}v_2 - \frac{\partial u_2}{\partial x}v_1 + u_1\frac{\partial v_2}{\partial x} - u_2\frac{\partial v_1}{\partial x} \end{bmatrix} = \left(\frac{\partial \boldsymbol{u}}{\partial x}\right) \times \boldsymbol{v} + \boldsymbol{u} \times \frac{\partial \boldsymbol{v}}{\partial x}$$

# 3 标量对向量求导

二次型是标量,设A与x无关,易知有

$$\begin{bmatrix}
\frac{\partial(\mathbf{u}^{\top}\mathbf{A}\mathbf{v})}{\partial\mathbf{x}}
\end{bmatrix}_{i} = \frac{\partial(\mathbf{u}^{\top}\mathbf{A}\mathbf{v})}{\partial\mathbf{x}_{i}} = \frac{\partial(\sum_{j}\sum_{k}u_{j}a_{jk}v_{k})}{\partial\mathbf{x}_{i}} = \sum_{j}\sum_{k}u_{j}a_{jk}\frac{\partial v_{k}}{\partial\mathbf{x}_{i}} + \sum_{j}\sum_{k}\frac{\partial u_{j}}{\partial\mathbf{x}_{i}}a_{jk}v_{k}$$

$$= \mathbf{u}^{\top}\mathbf{A}\frac{\partial\mathbf{v}}{\partial\mathbf{x}_{i}} + \mathbf{v}^{\top}\mathbf{A}^{\top}\frac{\partial\mathbf{u}}{\partial\mathbf{x}_{i}} = \left[\mathbf{u}^{\top}\mathbf{A}\frac{\partial\mathbf{v}}{\partial\mathbf{x}}\right]_{i} + \left[\mathbf{v}^{\top}\mathbf{A}^{\top}\frac{\partial\mathbf{u}}{\partial\mathbf{x}}\right]_{i}$$

$$\Rightarrow \frac{\partial(\mathbf{u}^{\top}\mathbf{A}\mathbf{v})}{\partial\mathbf{x}} = \mathbf{u}^{\top}\mathbf{A}\frac{\partial\mathbf{v}}{\partial\mathbf{x}} + \mathbf{v}^{\top}\mathbf{A}^{\top}\frac{\partial\mathbf{u}}{\partial\mathbf{x}}$$

特别的,

• 取 A = I, 则

$$rac{\partial (oldsymbol{u}^ op oldsymbol{v})}{\partial oldsymbol{x}} = oldsymbol{u}^ op rac{\partial oldsymbol{v}}{\partial oldsymbol{x}} + oldsymbol{v}^ op rac{\partial oldsymbol{u}}{\partial oldsymbol{x}}$$

进一步若 u = a 与 x 无关,则

$$rac{\partial (oldsymbol{a}^ op oldsymbol{v})}{\partial oldsymbol{x}} = oldsymbol{a}^ op rac{\partial oldsymbol{v}}{\partial oldsymbol{x}}, \quad rac{\partial (oldsymbol{a}^ op oldsymbol{x})}{\partial oldsymbol{x}} = oldsymbol{a}^ op rac{\partial oldsymbol{x}}{\partial oldsymbol{x}} = oldsymbol{a}^ op oldsymbol{A}$$

$$\frac{\partial (\boldsymbol{x}^{\top} \mathbf{A} \boldsymbol{x})}{\partial \boldsymbol{x}} = \boldsymbol{x}^{\top} \mathbf{A} \frac{\partial \boldsymbol{x}}{\partial \boldsymbol{x}} + \boldsymbol{x}^{\top} \mathbf{A}^{\top} \frac{\partial \boldsymbol{x}}{\partial \boldsymbol{x}} = \boldsymbol{x}^{\top} (\mathbf{A} + \mathbf{A}^{\top})$$

进一步若 A = I, 则

$$rac{\partial (oldsymbol{x}^ op oldsymbol{x})}{\partial oldsymbol{x}} = rac{\partial \|oldsymbol{x}\|^2}{\partial oldsymbol{x}} = 2oldsymbol{x}^ op$$

• 若  $\mathbf{A} = \mathbf{b}\mathbf{a}^{\mathsf{T}}$ ,则

$$\frac{\partial (\boldsymbol{x}^{\top} \boldsymbol{b} \boldsymbol{a}^{\top} \boldsymbol{x})}{\partial \boldsymbol{x}} = \frac{\partial (\boldsymbol{a}^{\top} \boldsymbol{x} \boldsymbol{x}^{\top} \boldsymbol{b})}{\partial \boldsymbol{x}} = \boldsymbol{x}^{\top} (\boldsymbol{a} \boldsymbol{b}^{\top} + \boldsymbol{b} \boldsymbol{a}^{\top})$$

• 更一般的有

$$\begin{split} \frac{\partial [(\mathbf{A}x+b)^{\top}\mathbf{C}(\mathbf{D}x+e)]}{\partial x} &= \frac{\partial (x^{\top}\mathbf{A}^{\top}\mathbf{C}\mathbf{D}x+b^{\top}\mathbf{C}\mathbf{D}x+x^{\top}\mathbf{A}^{\top}\mathbf{C}e+b^{\top}e)}{\partial x} \\ &= x^{\top}(\mathbf{A}^{\top}\mathbf{C}\mathbf{D}+\mathbf{D}^{\top}\mathbf{C}^{\top}\mathbf{A})+b^{\top}\mathbf{C}\mathbf{D}+e^{\top}\mathbf{C}^{\top}\mathbf{A} \\ &= (\mathbf{D}x+e)^{\top}\mathbf{C}^{\top}\mathbf{A}+(\mathbf{A}x+b)^{\top}\mathbf{C}\mathbf{D} \end{split}$$

范数也是标量, 若a与x无关,则

$$\left[\frac{\partial \|\boldsymbol{x} - \boldsymbol{a}\|}{\partial \boldsymbol{x}}\right]_{i} = \frac{\partial \|\boldsymbol{x} - \boldsymbol{a}\|}{\partial x_{i}} = \frac{\partial \sqrt{\sum_{j}(x_{j} - a_{j})^{2}}}{\partial x_{i}} = \frac{1}{2} \frac{2(x_{i} - a_{i})}{\sqrt{\sum_{j}(x_{j} - a_{j})^{2}}} = \frac{x_{i} - a_{i}}{\|\boldsymbol{x} - \boldsymbol{a}\|}$$

$$\Longrightarrow \frac{\partial \|\boldsymbol{x} - \boldsymbol{a}\|}{\partial \boldsymbol{x}} = \frac{(\boldsymbol{x} - \boldsymbol{a})^{\top}}{\|\boldsymbol{x} - \boldsymbol{a}\|}$$
(2)

# 4 向量对向量求导

若 A 与 x 无关, 易知有

$$\left[\frac{\partial(\mathbf{A}\boldsymbol{u})}{\partial\boldsymbol{x}}\right]_{ii} = \frac{\partial[\mathbf{A}\boldsymbol{u}]_i}{\partial x_j} = \frac{\partial(\sum_k a_{ik}u_k)}{\partial x_j} = \sum_k a_{ik}\frac{\partial u_k}{\partial x_j} = \left[\mathbf{A}\frac{\partial\boldsymbol{u}}{\partial\boldsymbol{x}}\right]_{ii} \Longrightarrow \frac{\partial(\mathbf{A}\boldsymbol{u})}{\partial\boldsymbol{x}} = \mathbf{A}\frac{\partial\boldsymbol{u}}{\partial\boldsymbol{x}}$$

特别的,若 u=x,则

$$\frac{\partial (\mathbf{A}x)}{\partial x} = \mathbf{A} \frac{\partial x}{\partial x} = \mathbf{A}$$

若 v = v(x),则

$$\left[\frac{\partial(v\boldsymbol{u})}{\partial\boldsymbol{x}}\right]_{ii} = \frac{\partial(vu_i)}{\partial x_i} = v\frac{\partial u_i}{\partial x_i} + u_i\frac{\partial v}{\partial x_i} = v\left[\frac{\partial \boldsymbol{u}}{\partial \boldsymbol{x}}\right]_{ii} + \left[\boldsymbol{u}\frac{\partial v}{\partial \boldsymbol{x}}\right]_{ii} \Longrightarrow \frac{\partial(v\boldsymbol{u})}{\partial \boldsymbol{x}} = v\frac{\partial \boldsymbol{u}}{\partial \boldsymbol{x}} + \boldsymbol{u}\frac{\partial v}{\partial \boldsymbol{x}}$$

注意第一项是标量乘以雅可比矩阵,第二项是列向量乘以行向量。

若a与x无关,结合式(2)可得

$$\left[\frac{\partial}{\partial \boldsymbol{x}} \frac{\boldsymbol{x} - \boldsymbol{a}}{\|\boldsymbol{x} - \boldsymbol{a}\|}\right]_{ij} = \frac{\partial}{\partial x_j} \frac{x_i - a_i}{\|\boldsymbol{x} - \boldsymbol{a}\|} = \frac{\delta_{ij} \|\boldsymbol{x} - \boldsymbol{a}\|}{\|\boldsymbol{x} - \boldsymbol{a}\|^2} - \frac{x_i - a_i}{\|\boldsymbol{x} - \boldsymbol{a}\|^2} \frac{\partial \|\boldsymbol{x} - \boldsymbol{a}\|}{\partial x_j} 
= \frac{\delta_{ij}}{\|\boldsymbol{x} - \boldsymbol{a}\|} - \frac{x_i - a_i}{\|\boldsymbol{x} - \boldsymbol{a}\|^2} \frac{x_j - a_j}{\|\boldsymbol{x} - \boldsymbol{a}\|} 
\Rightarrow \frac{\partial}{\partial \boldsymbol{x}} \frac{\boldsymbol{x} - \boldsymbol{a}}{\|\boldsymbol{x} - \boldsymbol{a}\|} = \frac{\mathbf{I}}{\|\boldsymbol{x} - \boldsymbol{a}\|} - \frac{(\boldsymbol{x} - \boldsymbol{a})(\boldsymbol{x} - \boldsymbol{a})^{\top}}{\|\boldsymbol{x} - \boldsymbol{a}\|^3}$$

### 5 矩阵对标量求导

若 u = u(x),  $\mathbf{V} = \mathbf{V}(x)$ , 则

$$\left[\frac{\partial(u\mathbf{V})}{\partial x}\right]_{ij} = \frac{\partial(uv_{ij})}{\partial x} = \frac{\partial u}{\partial x}v_{ij} + u\frac{\partial v_{ij}}{\partial x} = \frac{\partial u}{\partial x}\left[\mathbf{V}\right]_{ij} + u\left[\frac{\partial\mathbf{V}}{\partial x}\right]_{ij} \Longrightarrow \frac{\partial(u\mathbf{V})}{\partial x} = \frac{\partial u}{\partial x}\mathbf{V} + u\frac{\partial\mathbf{V}}{\partial x}$$

若乘积求导法则中的  $\mathbf{U}$  或  $\mathbf{V}$  可继续分解为 x 相关项的乘积,例如  $\mathbf{V} \leftarrow \mathbf{V}\mathbf{W}$ ,则

$$\frac{\partial (\mathbf{U}\mathbf{V}\mathbf{W})}{\partial x} = \frac{\partial \mathbf{U}}{\partial x}\mathbf{V}\mathbf{W} + \mathbf{U}\frac{\partial (\mathbf{V}\mathbf{W})}{\partial x} = \frac{\partial \mathbf{U}}{\partial x}\mathbf{V}\mathbf{W} + \mathbf{U}\left(\frac{\partial \mathbf{V}}{\partial x}\mathbf{W} + \mathbf{V}\frac{\partial \mathbf{W}}{\partial x}\right) = \frac{\partial \mathbf{U}}{\partial x}\mathbf{V}\mathbf{W} + \mathbf{U}\frac{\partial \mathbf{V}}{\partial x}\mathbf{W} + \mathbf{U}\mathbf{V}\frac{\partial \mathbf{W}}{\partial x}$$
(3)

由此可知若 A、B 与 x 无关,则

$$\frac{\partial (\mathbf{AUB})}{\partial x} = \mathbf{A} \frac{\partial \mathbf{U}}{\partial x} \mathbf{B}$$

当 U 为方阵、n 为正整数时有

$$\frac{\partial \mathbf{U}^{n}}{\partial x} = \mathbf{U}^{n-1} \frac{\partial \mathbf{U}}{\partial x} + \mathbf{U}^{n-2} \frac{\partial \mathbf{U}}{\partial x} \mathbf{U} + \dots + \mathbf{U} \frac{\partial \mathbf{U}}{\partial x} \mathbf{U}^{n-2} + \frac{\partial \mathbf{U}}{\partial x} \mathbf{U}^{n-1} = \sum_{i \in [n]} \mathbf{U}^{i-1} \frac{\partial \mathbf{U}}{\partial x} \mathbf{U}^{n-i}$$
(4)

令乘积求导法则中的  $V = U^{-1}$  可得

$$\mathbf{0} = \frac{\partial \mathbf{I}}{\partial x} = \frac{\partial (\mathbf{U}\mathbf{U}^{-1})}{\partial x} = \mathbf{U}\frac{\partial \mathbf{U}^{-1}}{\partial x} + \frac{\partial \mathbf{U}}{\partial x}\mathbf{U}^{-1} \Longrightarrow \frac{\partial \mathbf{U}^{-1}}{\partial x} = -\mathbf{U}^{-1}\frac{\partial \mathbf{U}}{\partial x}\mathbf{U}^{-1}$$
(5)

由此可知

$$\frac{\partial [\mathbf{X}^{-1}]_{kl}}{\partial x_{ij}} = \operatorname{tr}\left(\frac{\partial [\mathbf{X}^{-1}]_{kl}}{\partial \mathbf{X}^{-1}}\frac{\partial \mathbf{X}^{-1}}{\partial x_{ij}}\right) = -\operatorname{tr}\left(\mathbf{E}_{lk}\mathbf{X}^{-1}\frac{\partial \mathbf{X}}{\partial x_{ij}}\mathbf{X}^{-1}\right) = -\operatorname{tr}(\mathbf{X}^{-1}\mathbf{E}_{lk}\mathbf{X}^{-1}\mathbf{E}_{ij})$$

$$= -[\mathbf{X}^{-1}\mathbf{E}_{lk}\mathbf{X}^{-1}]_{ji} = -\sum_{p}\sum_{q}[\mathbf{X}^{-1}]_{jp}[\mathbf{E}_{lk}]_{pq}[\mathbf{X}^{-1}]_{qi} = -[\mathbf{X}^{-1}]_{jl}[\mathbf{X}^{-1}]_{ki}$$

结合式 (3) 还可得海森矩阵

$$\begin{split} \frac{\partial^{2}\mathbf{U}^{-1}}{\partial x \partial y} &= \frac{\partial}{\partial y} \left( -\mathbf{U}^{-1} \frac{\partial \mathbf{U}}{\partial x} \mathbf{U}^{-1} \right) = -\frac{\partial \mathbf{U}^{-1}}{\partial y} \frac{\partial \mathbf{U}}{\partial x} \mathbf{U}^{-1} - \mathbf{U}^{-1} \frac{\partial^{2}\mathbf{U}}{\partial x \partial y} \mathbf{U}^{-1} - \mathbf{U}^{-1} \frac{\partial \mathbf{U}}{\partial x} \frac{\partial \mathbf{U}^{-1}}{\partial y} \\ &= \mathbf{U}^{-1} \frac{\partial \mathbf{U}}{\partial y} \mathbf{U}^{-1} \frac{\partial \mathbf{U}}{\partial x} \mathbf{U}^{-1} - \mathbf{U}^{-1} \frac{\partial^{2}\mathbf{U}}{\partial x \partial y} \mathbf{U}^{-1} + \mathbf{U}^{-1} \frac{\partial \mathbf{U}}{\partial x} \mathbf{U}^{-1} \frac{\partial \mathbf{U}}{\partial y} \mathbf{U}^{-1} \\ &= \mathbf{U}^{-1} \left( \frac{\partial \mathbf{U}}{\partial y} \mathbf{U}^{-1} \frac{\partial \mathbf{U}}{\partial x} - \frac{\partial^{2}\mathbf{U}}{\partial x \partial y} + \frac{\partial \mathbf{U}}{\partial x} \mathbf{U}^{-1} \frac{\partial \mathbf{U}}{\partial y} \right) \mathbf{U}^{-1} \end{split}$$

矩阵除了常规的乘积外,还有克罗内克积和哈达玛积。设  $\mathbf{U} \in \mathbb{R}^{m \times n}$ ,  $\mathbf{V} \in \mathbb{R}^{p \times q}$ . 则

$$\frac{\partial (\mathbf{U} \otimes \mathbf{V})}{\partial x} = \begin{bmatrix} \frac{\partial u_{11}\mathbf{V}}{\partial x} & \frac{\partial u_{12}\mathbf{V}}{\partial x} & \cdots & \frac{\partial u_{1n}\mathbf{V}}{\partial x} \\ \frac{\partial u_{21}\mathbf{V}}{\partial x} & \frac{\partial u_{22}\mathbf{V}}{\partial x} & \cdots & \frac{\partial u_{2n}\mathbf{V}}{\partial x} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial u_{m1}\mathbf{V}}{\partial x} & \frac{\partial u_{m2}\mathbf{V}}{\partial x} & \cdots & \frac{\partial u_{mn}\mathbf{V}}{\partial x} \end{bmatrix}$$

$$=\begin{bmatrix} \frac{\partial u_{11}}{\partial x}\mathbf{V} + u_{11}\frac{\partial \mathbf{V}}{\partial x} & \frac{\partial u_{12}}{\partial x}\mathbf{V} + u_{12}\frac{\partial \mathbf{V}}{\partial x} & \cdots & \frac{\partial u_{1n}}{\partial x}\mathbf{V} + u_{1n}\frac{\partial \mathbf{V}}{\partial x} \\ \frac{\partial u_{21}}{\partial x}\mathbf{V} + u_{21}\frac{\partial \mathbf{V}}{\partial x} & \frac{\partial u_{22}}{\partial x}\mathbf{V} + u_{22}\frac{\partial \mathbf{V}}{\partial x} & \cdots & \frac{\partial u_{2n}}{\partial x}\mathbf{V} + u_{2n}\frac{\partial \mathbf{V}}{\partial x} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial u_{m1}}{\partial x}\mathbf{V} + u_{m1}\frac{\partial \mathbf{V}}{\partial x} & \frac{\partial u_{m2}}{\partial x}\mathbf{V} + u_{m2}\frac{\partial \mathbf{V}}{\partial x} & \cdots & \frac{\partial u_{mn}}{\partial x}\mathbf{V} + u_{mn}\frac{\partial \mathbf{V}}{\partial x} \end{bmatrix}$$

$$=\begin{bmatrix} \frac{\partial u_{11}}{\partial x}\mathbf{V} & \frac{\partial u_{12}}{\partial x}\mathbf{V} & \cdots & \frac{\partial u_{1n}}{\partial x}\mathbf{V} \\ \frac{\partial u_{21}}{\partial x}\mathbf{V} & \frac{\partial u_{22}}{\partial x}\mathbf{V} & \cdots & \frac{\partial u_{2n}}{\partial x}\mathbf{V} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial u_{m1}}{\partial x}\mathbf{V} & \frac{\partial u_{m2}}{\partial x}\mathbf{V} & \cdots & \frac{\partial u_{mn}}{\partial x}\mathbf{V} \end{bmatrix} + \begin{bmatrix} u_{11}\frac{\partial \mathbf{V}}{\partial x} & u_{12}\frac{\partial \mathbf{V}}{\partial x} & \cdots & u_{1n}\frac{\partial \mathbf{V}}{\partial x} \\ u_{21}\frac{\partial \mathbf{V}}{\partial x} & u_{22}\frac{\partial \mathbf{V}}{\partial x} & \cdots & u_{2n}\frac{\partial \mathbf{V}}{\partial x} \\ \vdots & \vdots & \ddots & \vdots \\ u_{m1}\frac{\partial \mathbf{V}}{\partial x} & u_{m2}\frac{\partial \mathbf{V}}{\partial x} & \cdots & u_{mn}\frac{\partial \mathbf{V}}{\partial x} \end{bmatrix}$$

$$= \frac{\partial \mathbf{U}}{\partial x} \otimes \mathbf{V} + \mathbf{U} \otimes \frac{\partial \mathbf{V}}{\partial x}$$

设  $\mathbf{U}, \mathbf{V} \in \mathbb{R}^{m \times n}$ ,则

$$\frac{\partial(\mathbf{U} \odot \mathbf{V})}{\partial x} = \begin{bmatrix}
\frac{\partial u_{11}v_{11}}{\partial x} & \frac{\partial u_{12}v_{12}}{\partial x} & \cdots & \frac{\partial u_{1n}v_{1n}}{\partial x} \\
\frac{\partial u_{21}v_{21}}{\partial x} & \frac{\partial u_{22}v_{22}}{\partial x} & \cdots & \frac{\partial u_{2n}v_{2n}}{\partial x} \\
\vdots & \vdots & \ddots & \vdots \\
\frac{\partial u_{m1}v_{m1}}{\partial x} & \frac{\partial u_{m2}v_{m2}}{\partial x} & \cdots & \frac{\partial u_{mn}v_{mn}}{\partial x}
\end{bmatrix} \\
= \begin{bmatrix}
\frac{\partial u_{11}}{\partial x}v_{11} & \frac{\partial u_{12}}{\partial x}v_{12} & \cdots & \frac{\partial u_{1n}}{\partial x}v_{1n} \\
\frac{\partial u_{21}}{\partial x}v_{21} & \frac{\partial u_{22}}{\partial x}v_{22} & \cdots & \frac{\partial u_{2n}}{\partial x}v_{2n} \\
\vdots & \vdots & \ddots & \vdots \\
\frac{\partial u_{m1}}{\partial x}v_{m1} & \frac{\partial u_{m2}}{\partial x}v_{m2} & \cdots & \frac{\partial u_{mn}}{\partial x}v_{mn}
\end{bmatrix} + \begin{bmatrix}
u_{11}\frac{\partial v_{11}}{\partial x} & u_{12}\frac{\partial v_{12}}{\partial x} & \cdots & u_{1n}\frac{\partial v_{1n}}{\partial x} \\
u_{21}\frac{\partial v_{21}}{\partial x} & u_{22}\frac{\partial v_{22}}{\partial x} & \cdots & u_{2n}\frac{\partial v_{2n}}{\partial x} \\
\vdots & \vdots & \ddots & \vdots \\
u_{m1}\frac{\partial v_{m1}}{\partial x} & u_{m2}\frac{\partial v_{m2}}{\partial x} & \cdots & u_{mn}\frac{\partial v_{mn}}{\partial x}
\end{bmatrix} \\
= \frac{\partial \mathbf{U}}{\partial x} \odot \mathbf{V} + \mathbf{U} \odot \frac{\partial \mathbf{V}}{\partial x}$$

设多项式函数  $g(x)=a_0+a_1x+a_2x^2+a_3x^3+\cdots$ ,则  $g'(x)=a_1+2a_2x+3a_3x^2+\cdots$ ,若 A 为 与 x 无关的方阵,记

$$g(x\mathbf{A}) = a_0\mathbf{I} + a_1x\mathbf{A} + a_2x^2\mathbf{A}^2 + a_3x^3\mathbf{A}^3 + \cdots$$
  
 $g'(x\mathbf{A}) = a_1\mathbf{I} + 2a_2x\mathbf{A} + 3a_3x^2\mathbf{A}^2 + \cdots$ 

易知有

$$\frac{\partial g(x\mathbf{A})}{\partial x} = a_1\mathbf{A} + 2a_2x\mathbf{A}^2 + 3a_3x^2\mathbf{A}^3 + \cdots$$

$$= \mathbf{A}(a_1\mathbf{I} + 2a_2x\mathbf{A} + 3a_3x^2\mathbf{A}^2 + \cdots) = \mathbf{A}g'(x\mathbf{A})$$

$$= (a_1\mathbf{I} + 2a_2x\mathbf{A} + 3a_3x^2\mathbf{A}^2 + \cdots)\mathbf{A} = g'(x\mathbf{A})\mathbf{A}$$

对于  $e^x$ 、 $\ln x$ 、 $\sin x$ 、 $\cos x$ , 上式依然适用, 例如

$$\frac{\partial e^{x\mathbf{A}}}{\partial x} = \mathbf{A}e^{x\mathbf{A}} = e^{x\mathbf{A}}\mathbf{A}$$

# 6 标量对矩阵求导

矩阵常见的标量函数有迹和行列式,二次型可以归为迹来处理。

#### 6.1 迹对矩阵求导

若 a 与 X 无关, U = U(X), V = V(X), 则以下结论是显然的:

$$\frac{\partial \mathrm{tr}(\mathbf{X})}{\partial \mathbf{X}} = \mathbf{I}, \quad \frac{\partial \mathrm{tr}(\mathbf{U} + \mathbf{V})}{\partial \mathbf{X}} = \frac{\partial \mathrm{tr}(\mathbf{U})}{\partial \mathbf{X}} + \frac{\partial \mathrm{tr}(\mathbf{V})}{\partial \mathbf{X}}, \quad \frac{\partial \mathrm{tr}(a\mathbf{U})}{\partial \mathbf{X}} = a \frac{\partial \mathrm{tr}(\mathbf{U})}{\partial \mathbf{X}}$$

对于乘积有

$$\left[\frac{\partial \operatorname{tr}(\mathbf{U}\mathbf{V})}{\partial \mathbf{X}}\right]_{ij} = \frac{\partial \operatorname{tr}(\mathbf{U}\mathbf{V})}{\partial x_{ji}} = \frac{\partial (\sum_{p} \sum_{q} u_{pq} v_{qp})}{\partial x_{ji}} = \sum_{p} \sum_{q} \left(\frac{\partial u_{pq}}{\partial x_{ji}} v_{qp} + u_{pq} \frac{\partial v_{qp}}{\partial x_{ji}}\right) \\
= \operatorname{tr}\left(\frac{\partial \mathbf{U}}{\partial x_{ji}}\mathbf{V}\right) + \operatorname{tr}\left(\mathbf{U}\frac{\partial \mathbf{V}}{\partial x_{ji}}\right) = \operatorname{tr}\left(\frac{\partial (\mathbf{U}\mathbf{V})}{\partial x_{ji}}\right)$$

由此可知迹和求导的顺序可以交换。特别的,

• 取 U = BA 与 X 无关, V = X, 则

$$\left[\frac{\partial tr(\mathbf{BAX})}{\partial \mathbf{X}}\right]_{ij} = tr\left(\mathbf{BA}\frac{\partial \mathbf{X}}{\partial x_{ji}}\right) = tr(\mathbf{BAE}_{ji}) = [\mathbf{BA}]_{ij} \Longrightarrow \frac{\partial tr(\mathbf{BAX})}{\partial \mathbf{X}} = \frac{\partial tr(\mathbf{AXB})}{\partial \mathbf{X}} = \mathbf{BA}$$

取 U = BA 与 X 无关, V = X<sup>⊤</sup>, 则

$$\frac{\partial \text{tr}(BAX^\top)}{\partial X} = \frac{\partial \text{tr}(XA^\top B^\top)}{\partial X} = \frac{\partial \text{tr}(A^\top B^\top X)}{\partial X} = A^\top B^\top$$

• 取  $\mathbf{U} = \mathbf{A} \to \mathbf{X} \times \mathbf{X}^{\mathsf{T}}$ , 则

$$\left[\frac{\partial \operatorname{tr}(\mathbf{A}\mathbf{X}\mathbf{X}^{\top})}{\partial \mathbf{X}}\right]_{ij} = \operatorname{tr}\left(\mathbf{A}\frac{\partial \mathbf{X}\mathbf{X}^{\top}}{\partial x_{ji}}\right) = \operatorname{tr}\left(\mathbf{A}\frac{\partial \mathbf{X}}{\partial x_{ji}}\mathbf{X}^{\top}\right) + \operatorname{tr}\left(\mathbf{A}\mathbf{X}\frac{\partial \mathbf{X}^{\top}}{\partial x_{ji}}\right) \\
= \operatorname{tr}(\mathbf{A}\mathbf{E}_{ji}\mathbf{X}^{\top}) + \operatorname{tr}(\mathbf{A}\mathbf{X}\mathbf{E}_{ij}) \\
= [\mathbf{X}^{\top}\mathbf{A}]_{ij} + [\mathbf{A}\mathbf{X}]_{ji}$$

从而

$$\frac{\partial \text{tr}(\mathbf{A}\mathbf{X}\mathbf{X}^{\top})}{\partial \mathbf{X}} = \frac{\partial \text{tr}(\mathbf{X}^{\top}\mathbf{A}\mathbf{X})}{\partial \mathbf{X}} = \frac{\partial \text{tr}(\mathbf{X}\mathbf{X}^{\top}\mathbf{A})}{\partial \mathbf{X}} = \mathbf{X}^{\top}\mathbf{A} + \mathbf{X}^{\top}\mathbf{A}^{\top} = \mathbf{X}^{\top}(\mathbf{A} + \mathbf{A}^{\top})$$

取 U = A 与 X 无关, V = X<sup>T</sup>X, 则

$$\left[\frac{\partial \operatorname{tr}(\mathbf{A}\mathbf{X}^{\top}\mathbf{X})}{\partial \mathbf{X}}\right]_{ij} = \operatorname{tr}\left(\mathbf{A}\frac{\partial \mathbf{X}^{\top}\mathbf{X}}{\partial x_{ji}}\right) = \operatorname{tr}\left(\mathbf{A}\frac{\partial \mathbf{X}^{\top}}{\partial x_{ji}}\mathbf{X}\right) + \operatorname{tr}\left(\mathbf{A}\mathbf{X}^{\top}\frac{\partial \mathbf{X}}{\partial x_{ji}}\right) 
= \operatorname{tr}(\mathbf{A}\mathbf{E}_{ij}\mathbf{X}) + \operatorname{tr}(\mathbf{A}\mathbf{X}^{\top}\mathbf{E}_{ji}) 
= [\mathbf{X}\mathbf{A}]_{ji} + [\mathbf{A}\mathbf{X}^{\top}]_{ij}$$

从而

$$\frac{\partial \mathrm{tr}(\mathbf{A}\mathbf{X}^{\top}\mathbf{X})}{\partial \mathbf{X}} = \frac{\partial \mathrm{tr}(\mathbf{X}\mathbf{A}\mathbf{X}^{\top})}{\partial \mathbf{X}} = \frac{\partial \mathrm{tr}(\mathbf{X}^{\top}\mathbf{X}\mathbf{A})}{\partial \mathbf{X}} = (\mathbf{A} + \mathbf{A}^{\top})\mathbf{X}^{\top}$$

取 U = BA 与 X 无关, V = X<sup>-1</sup>, 结合式 (5) 可得

$$\left[\frac{\partial \operatorname{tr}(\mathbf{B}\mathbf{A}\mathbf{X}^{-1})}{\partial \mathbf{X}}\right]_{ij} = \operatorname{tr}\left(\mathbf{B}\mathbf{A}\frac{\partial \mathbf{X}^{-1}}{\partial x_{ji}}\right) = \operatorname{tr}\left(-\mathbf{B}\mathbf{A}\mathbf{X}^{-1}\frac{\partial \mathbf{X}}{\partial x_{ji}}\mathbf{X}^{-1}\right)$$

$$= -\operatorname{tr}\left(\mathbf{X}^{-1}\mathbf{B}\mathbf{A}\mathbf{X}^{-1}\mathbf{E}_{ji}\right) = -[\mathbf{X}^{-1}\mathbf{B}\mathbf{A}\mathbf{X}^{-1}]_{ij}$$

$$\Longrightarrow \frac{\partial \operatorname{tr}(\mathbf{B}\mathbf{A}\mathbf{X}^{-1})}{\partial \mathbf{X}} = \frac{\partial \operatorname{tr}(\mathbf{A}\mathbf{X}^{-1}\mathbf{B})}{\partial \mathbf{X}} = -\mathbf{X}^{-1}\mathbf{B}\mathbf{A}\mathbf{X}^{-1}$$

• 取 U = I,  $V = (X + A)^{-1}$ , 结合式 (5) 可得

$$\begin{split} \left[ \frac{\partial \operatorname{tr}(\mathbf{X} + \mathbf{A})^{-1}}{\partial \mathbf{X}} \right]_{ij} &= \operatorname{tr} \left( \frac{\partial (\mathbf{X} + \mathbf{A})^{-1}}{\partial x_{ji}} \right) = -\operatorname{tr} \left( (\mathbf{X} + \mathbf{A})^{-1} \frac{\partial (\mathbf{X} + \mathbf{A})}{\partial x_{ji}} (\mathbf{X} + \mathbf{A})^{-1} \right) \\ &= -\operatorname{tr} \left( (\mathbf{X} + \mathbf{A})^{-1} (\mathbf{X} + \mathbf{A})^{-1} \mathbf{E}_{ji} \right) = -[(\mathbf{X} + \mathbf{A})^{-1} (\mathbf{X} + \mathbf{A})^{-1}]_{ij} \\ &\Longrightarrow \frac{\partial \operatorname{tr}(\mathbf{X} + \mathbf{A})^{-1}}{\partial \mathbf{X}} = -(\mathbf{X} + \mathbf{A})^{-1} (\mathbf{X} + \mathbf{A})^{-1} \end{split}$$

• 取 U = AXB,  $V = X^TC$ , 其中  $A \setminus B \setminus C$  与 X 无关,则

$$\left[\frac{\partial \operatorname{tr}(\mathbf{A}\mathbf{X}\mathbf{B}\mathbf{X}^{\top}\mathbf{C})}{\partial \mathbf{X}}\right]_{ij} = \operatorname{tr}\left(\frac{\partial(\mathbf{A}\mathbf{X}\mathbf{B})}{\partial x_{ji}}\mathbf{X}^{\top}\mathbf{C}\right) + \operatorname{tr}\left(\mathbf{A}\mathbf{X}\mathbf{B}\frac{\partial(\mathbf{X}^{\top}\mathbf{C})}{\partial x_{ji}}\right)$$

$$= \operatorname{tr}\left(\mathbf{A}\mathbf{E}_{ji}\mathbf{B}\mathbf{X}^{\top}\mathbf{C}\right) + \operatorname{tr}\left(\mathbf{A}\mathbf{X}\mathbf{B}\mathbf{E}_{ij}\mathbf{C}\right)$$

$$= [\mathbf{B}\mathbf{X}^{\top}\mathbf{C}\mathbf{A}]_{ij} + [\mathbf{C}\mathbf{A}\mathbf{X}\mathbf{B}]_{ji}$$

$$\Rightarrow \frac{\partial \operatorname{tr}(\mathbf{A}\mathbf{X}\mathbf{B}\mathbf{X}^{\top}\mathbf{C})}{\partial \mathbf{X}} = \mathbf{B}\mathbf{X}^{\top}\mathbf{C}\mathbf{A} + \mathbf{B}^{\top}\mathbf{X}^{\top}\mathbf{A}^{\top}\mathbf{C}^{\top}$$

• 取  $U = AX^TB$ , V = XC, 其中  $A \setminus B \setminus C$  与 X 无关,则

$$\left[\frac{\partial \operatorname{tr}(\mathbf{A}\mathbf{X}^{\top}\mathbf{B}\mathbf{X}\mathbf{C})}{\partial \mathbf{X}}\right]_{ij} = \operatorname{tr}\left(\frac{\partial(\mathbf{A}\mathbf{X}^{\top}\mathbf{B})}{\partial x_{ji}}\mathbf{X}\mathbf{C}\right) + \operatorname{tr}\left(\mathbf{A}\mathbf{X}^{\top}\mathbf{B}\frac{\partial(\mathbf{X}\mathbf{C})}{\partial x_{ji}}\right)$$

$$= \operatorname{tr}\left(\mathbf{A}\mathbf{E}_{ij}\mathbf{B}\mathbf{X}\mathbf{C}\right) + \operatorname{tr}\left(\mathbf{A}\mathbf{X}^{\top}\mathbf{B}\mathbf{E}_{ji}\mathbf{C}\right)$$

$$= [\mathbf{B}\mathbf{X}\mathbf{C}\mathbf{A}]_{ji} + [\mathbf{C}\mathbf{A}\mathbf{X}^{\top}\mathbf{B}]_{ij}$$

$$\Rightarrow \frac{\partial \operatorname{tr}(\mathbf{A}\mathbf{X}^{\top}\mathbf{B}\mathbf{X}\mathbf{C})}{\partial \mathbf{X}} = \mathbf{C}\mathbf{A}\mathbf{X}^{\top}\mathbf{B} + \mathbf{A}^{\top}\mathbf{C}^{\top}\mathbf{X}^{\top}\mathbf{B}^{\top}$$

• 取 U = BA = X 无关,  $V = X^n$ , 其中 n 是正整数, 结合式 (4) 可得

$$\left[\frac{\partial \operatorname{tr}(\mathbf{B}\mathbf{A}\mathbf{X}^{n})}{\partial \mathbf{X}}\right]_{ij} = \operatorname{tr}\left(\mathbf{B}\mathbf{A}\frac{\partial \mathbf{X}^{n}}{\partial x_{ji}}\right) = \operatorname{tr}\left(\mathbf{B}\mathbf{A}\sum_{k\in[n]}\mathbf{X}^{k-1}\frac{\partial \mathbf{X}}{\partial x_{ji}}\mathbf{X}^{n-k}\right) = \sum_{k\in[n]}\operatorname{tr}\left(\mathbf{B}\mathbf{A}\mathbf{X}^{k-1}\frac{\partial \mathbf{X}}{\partial x_{ji}}\mathbf{X}^{n-k}\right) \\
= \sum_{k\in[n]}\operatorname{tr}(\mathbf{X}^{n-k}\mathbf{B}\mathbf{A}\mathbf{X}^{k-1}\mathbf{E}_{ji}) = \sum_{k\in[n]}[\mathbf{X}^{n-k}\mathbf{B}\mathbf{A}\mathbf{X}^{k-1}]_{ij} \\
\implies \frac{\partial \operatorname{tr}(\mathbf{B}\mathbf{A}\mathbf{X}^{n})}{\partial \mathbf{X}} = \frac{\partial \operatorname{tr}(\mathbf{A}\mathbf{X}^{n}\mathbf{B})}{\partial \mathbf{X}} = \sum_{k\in[n]}\mathbf{X}^{n-k}\mathbf{B}\mathbf{A}\mathbf{X}^{k-1}$$

进一步若 A = B = I, 则

$$\frac{\partial \operatorname{tr}(\mathbf{X}^n)}{\partial \mathbf{X}} = \sum_{k \in [n]} \mathbf{X}^{n-k} \mathbf{X}^{k-1} = \sum_{k \in [n]} \mathbf{X}^{n-1} = n \mathbf{X}^{n-1}$$

不难发现形式上和单变量的求导公式  $\partial x^n/\partial x = nx^{n-1}$  是一样的。类似的记

$$e^{X} = I + X + \frac{X^{2}}{2!} + \frac{X^{3}}{3!} + \cdots$$

$$\sin X = X - \frac{X^{3}}{3!} + \frac{X^{5}}{5!} - \cdots$$

$$\cos X = I - \frac{X^{2}}{2!} + \frac{X^{4}}{4!} - \frac{X^{6}}{6!} + \cdots$$

结合式 (4) 可得

$$\begin{split} \frac{\partial \mathrm{tr}(e^{\mathbf{X}})}{\partial \mathbf{X}} &= \frac{\partial}{\partial \mathbf{X}} \mathrm{tr} \left( \mathbf{I} + \mathbf{X} + \frac{\mathbf{X}^2}{2!} + \frac{\mathbf{X}^3}{3!} + \cdots \right) \\ &= \frac{\partial \mathrm{tr}(\mathbf{I})}{\partial \mathbf{X}} + \frac{\partial \mathrm{tr}(\mathbf{X})}{\partial \mathbf{X}} + \frac{1}{2!} \frac{\partial \mathrm{tr}(\mathbf{X}^2)}{\partial \mathbf{X}} + \frac{1}{3!} \frac{\partial \mathrm{tr}(\mathbf{X}^3)}{\partial \mathbf{X}} + \cdots \\ &= \mathbf{I} + \mathbf{X} + \frac{\mathbf{X}^2}{2!} + \cdots = e^{\mathbf{X}} \end{split}$$

以及

$$\frac{\partial \operatorname{tr}(\sin \mathbf{X})}{\partial \mathbf{X}} = \frac{\partial}{\partial \mathbf{X}} \operatorname{tr} \left( \mathbf{X} - \frac{\mathbf{X}^3}{3!} + \frac{\mathbf{X}^5}{5!} - \cdots \right)$$

$$= \frac{1}{1!} \frac{\partial \operatorname{tr}(\mathbf{X})}{\partial \mathbf{X}} - \frac{1}{3!} \frac{\partial \operatorname{tr}(\mathbf{X}^3)}{\partial \mathbf{X}} + \frac{1}{5!} \frac{\partial \operatorname{tr}(\mathbf{X}^5)}{\partial \mathbf{X}} - \cdots$$

$$= \mathbf{I} - \frac{\mathbf{X}^2}{2!} + \frac{\mathbf{X}^4}{4!} - \cdots = \cos \mathbf{X}$$

$$\frac{\partial \operatorname{tr}(\cos \mathbf{X})}{\partial \mathbf{X}} = \frac{\partial}{\partial \mathbf{X}} \operatorname{tr} \left( \mathbf{I} - \frac{\mathbf{X}^2}{2!} + \frac{\mathbf{X}^4}{4!} - \frac{\mathbf{X}^6}{6!} + \cdots \right)$$

$$= \frac{\partial \operatorname{tr}(\mathbf{I})}{\partial \mathbf{X}} - \frac{1}{2!} \frac{\partial \operatorname{tr}(\mathbf{X}^2)}{\partial \mathbf{X}} + \frac{1}{4!} \frac{\partial \operatorname{tr}(\mathbf{X}^4)}{\partial \mathbf{X}} - \frac{1}{6!} \frac{\partial \operatorname{tr}(\mathbf{X}^6)}{\partial \mathbf{X}} + \cdots$$

$$= -\mathbf{X} + \frac{\mathbf{X}^3}{3!} - \frac{\mathbf{X}^5}{5!} + \cdots = -\sin \mathbf{X}$$

均与单变量的求导公式一样。

•  $\mathfrak{P}$   $\mathbf{U} = \mathbf{I}$ ,  $\mathbf{V} = \mathbf{A} \otimes \mathbf{X}$ ,  $\mathfrak{N}$ 

$$\left[\frac{\partial \operatorname{tr}(\mathbf{A} \otimes \mathbf{X})}{\partial \mathbf{X}}\right]_{ij} = \operatorname{tr}\left(\frac{\partial \mathbf{A} \otimes \mathbf{X}}{\partial x_{ji}}\right) = \operatorname{tr}\left(\mathbf{A} \otimes \frac{\partial \mathbf{X}}{\partial x_{ji}}\right) = \operatorname{tr}(\mathbf{A} \otimes \mathbf{E}_{ji}) = \operatorname{tr}(\mathbf{A})\delta_{ij}$$

$$\Longrightarrow \frac{\partial \operatorname{tr}(\mathbf{A} \otimes \mathbf{X})}{\partial \mathbf{X}} = \operatorname{tr}(\mathbf{A})\mathbf{I}$$

•  $\mathfrak{P}$   $\mathbf{U} = \mathbf{I}$ ,  $\mathbf{V} = \mathbf{X} \otimes \mathbf{X}$ ,  $\mathfrak{N}$ 

$$\begin{split} \left[ \frac{\partial \operatorname{tr}(\mathbf{X} \otimes \mathbf{X})}{\partial \mathbf{X}} \right]_{ij} &= \operatorname{tr}\left( \frac{\partial \mathbf{X} \otimes \mathbf{X}}{\partial x_{ji}} \right) = \operatorname{tr}\left( \frac{\partial \mathbf{X}}{\partial x_{ji}} \otimes \mathbf{X} + \mathbf{X} \otimes \frac{\partial \mathbf{X}}{\partial x_{ji}} \right) \\ &= \operatorname{tr}(\mathbf{E}_{ji} \otimes \mathbf{X}) + \operatorname{tr}(\mathbf{X} \otimes \mathbf{E}_{ji}) = 2\operatorname{tr}(\mathbf{X})\delta_{ij} \\ &\Longrightarrow \frac{\partial \operatorname{tr}(\mathbf{X} \otimes \mathbf{X})}{\partial \mathbf{X}} = 2\operatorname{tr}(\mathbf{X})\mathbf{I} \end{split}$$

#### 6.2 行列式对矩阵求导

设  $\mathbf{X} \in \mathbb{R}^{m \times n}$ 、 $\mathbf{A} \in \mathbb{R}^{l \times m}$ 、 $\mathbf{B} \in \mathbb{R}^{n \times l}$ 、 $\mathbf{Y} = \mathbf{A}\mathbf{X}\mathbf{B} \in \mathbb{R}^{l \times l}$ ,  $\mathbf{A}$ 、 $\mathbf{B} \to \mathbf{X}$  无关, 结合式 (1) 易知

$$\left[\frac{\partial |\mathbf{A}\mathbf{X}\mathbf{B}|}{\partial \mathbf{X}}\right]_{ij} = \frac{\partial |\mathbf{Y}|}{\partial x_{ji}} = \sum_{p} \sum_{q} \frac{\partial |\mathbf{Y}|}{\partial y_{pq}} \frac{\partial y_{pq}}{\partial x_{ji}} = \operatorname{tr}\left(\frac{\partial |\mathbf{Y}|}{\partial \mathbf{Y}} \frac{\partial \mathbf{Y}}{\partial x_{ji}}\right)$$

其中第二项

$$\frac{\partial \mathbf{Y}}{\partial x_{ji}} = \frac{\partial (\mathbf{AXB})}{\partial x_{ji}} = \mathbf{A} \frac{\partial \mathbf{X}}{\partial x_{ji}} \mathbf{B} = \mathbf{A} \mathbf{E}_{ji} \mathbf{B}$$

记  $y_{ii}$  有一个微小增量  $\epsilon$  后的矩阵为  $\mathbf{Y}(y_{ii}+\epsilon)$ , 根据第 i 行拉普拉斯展开易知

$$|\mathbf{Y}(y_{ii} + \epsilon)| - |\mathbf{Y}| = \epsilon C_{ii}$$

其中  $C_{ii}$  是关于  $y_{ii}$  的代数余子式, 因此

$$\left[\frac{\partial |\mathbf{Y}|}{\partial \mathbf{Y}}\right]_{ii} = \frac{\partial |\mathbf{Y}|}{\partial y_{ii}} = \lim_{\epsilon \to 0} \frac{|\mathbf{Y}(y_{ji} + \epsilon)| - |\mathbf{Y}|}{\epsilon} = C_{ji}$$

故第一项

$$\frac{\partial |\mathbf{Y}|}{\partial \mathbf{Y}} = \begin{bmatrix} C_{11} & C_{21} & \cdots & C_{n1} \\ C_{12} & C_{22} & \cdots & C_{n2} \\ \vdots & \vdots & \ddots & \vdots \\ C_{1n} & C_{2n} & \cdots & C_{nn} \end{bmatrix} = \mathbf{Y}^*$$

代入可得

$$\left[\frac{\partial |\mathbf{A}\mathbf{X}\mathbf{B}|}{\partial \mathbf{X}}\right]_{ij} = \operatorname{tr}\left(\frac{\partial |\mathbf{Y}|}{\partial \mathbf{Y}}\frac{\partial \mathbf{Y}}{\partial x_{ji}}\right) = \operatorname{tr}(\mathbf{Y}^*\mathbf{A}\mathbf{E}_{ji}\mathbf{B}) = [\mathbf{B}\mathbf{Y}^*\mathbf{A}]_{ij}$$

$$\Longrightarrow \frac{\partial |\mathbf{A}\mathbf{X}\mathbf{B}|}{\partial \mathbf{X}} = \mathbf{B}(\mathbf{A}\mathbf{X}\mathbf{B})^*\mathbf{A}$$

若 X、A、B 均为可逆方阵,则 Y = AXB 亦为可逆方阵,于是

$$\frac{\partial |\mathbf{A}\mathbf{X}\mathbf{B}|}{\partial \mathbf{X}} = \mathbf{B}(\mathbf{A}\mathbf{X}\mathbf{B})^*\mathbf{A} = \mathbf{B}|\mathbf{A}\mathbf{X}\mathbf{B}|(\mathbf{A}\mathbf{X}\mathbf{B})^{-1}\mathbf{A} = |\mathbf{A}\mathbf{X}\mathbf{B}|\mathbf{X}^{-1}$$
(6)

进一步若 A = B = I, 则

$$\frac{\partial |\mathbf{X}|}{\partial \mathbf{X}} = \mathbf{X}^* = |\mathbf{X}|\mathbf{X}^{-1}$$

由此可得

$$\frac{\partial |\mathbf{X}^n|}{\partial \mathbf{X}} = \frac{\partial |\mathbf{X}|^n}{\partial \mathbf{X}} = n|\mathbf{X}|^{n-1}\mathbf{X}^* = n|\mathbf{X}|^n\mathbf{X}^{-1} = n|\mathbf{X}^n|\mathbf{X}^{-1}$$

若a与X无关,则

$$\frac{\partial \ln |aX|}{\partial X} = \frac{\partial \ln a^m |X|}{\partial X} = \frac{\partial \ln a^m}{\partial X} + \frac{\partial \ln |X|}{\partial X} = \frac{1}{|X|} \frac{\partial |X|}{\partial X} = \frac{X^*}{|X|} = X^{-1}$$

设  $X \in \mathbb{R}^{m \times n}$ 、 $A \in \mathbb{R}^{m \times m}$ 、 $Y = X^{\top}AX \in \mathbb{R}^{n \times n}$  可逆,A 与 X 无关,易知有

$$\left[\frac{\partial |\mathbf{X}^{\top} \mathbf{A} \mathbf{X}|}{\partial \mathbf{X}}\right]_{ij} = \operatorname{tr}\left(\mathbf{Y}^* \frac{\partial \mathbf{X}^{\top} \mathbf{A} \mathbf{X}}{\partial x_{ji}}\right) = \operatorname{tr}\left(\mathbf{Y}^* \frac{\partial \mathbf{X}^{\top}}{\partial x_{ji}} \mathbf{A} \mathbf{X}\right) + \operatorname{tr}\left(\mathbf{Y}^* \mathbf{X}^{\top} \mathbf{A} \frac{\partial \mathbf{X}}{\partial x_{ji}}\right) \\
= \operatorname{tr}(\mathbf{Y}^* \mathbf{E}_{ij} \mathbf{A} \mathbf{X}) + \operatorname{tr}(\mathbf{Y}^* \mathbf{X}^{\top} \mathbf{A} \mathbf{E}_{ji}) = [\mathbf{A} \mathbf{X} \mathbf{Y}^*]_{ji} + [\mathbf{Y}^* \mathbf{X}^{\top} \mathbf{A}]_{ij}$$

于是

$$\begin{split} \frac{\partial |\mathbf{X}^{\top} \mathbf{A} \mathbf{X}|}{\partial \mathbf{X}} &= (\mathbf{A} \mathbf{X} \mathbf{Y}^*)^{\top} + \mathbf{Y}^* \mathbf{X}^{\top} \mathbf{A} = (\mathbf{A} \mathbf{X} | \mathbf{X}^{\top} \mathbf{A} \mathbf{X} | (\mathbf{X}^{\top} \mathbf{A} \mathbf{X})^{-1})^{\top} + |\mathbf{X}^{\top} \mathbf{A} \mathbf{X}| (\mathbf{X}^{\top} \mathbf{A} \mathbf{X})^{-1} \mathbf{X}^{\top} \mathbf{A} \\ &= |\mathbf{X}^{\top} \mathbf{A} \mathbf{X}| (\mathbf{X}^{\top} \mathbf{A}^{\top} \mathbf{X})^{-1} \mathbf{X}^{\top} \mathbf{A}^{\top} + |\mathbf{X}^{\top} \mathbf{A} \mathbf{X}| (\mathbf{X}^{\top} \mathbf{A} \mathbf{X})^{-1} \mathbf{X}^{\top} \mathbf{A} \\ &= |\mathbf{X}^{\top} \mathbf{A} \mathbf{X}| ((\mathbf{X}^{\top} \mathbf{A}^{\top} \mathbf{X})^{-1} \mathbf{X}^{\top} \mathbf{A}^{\top} + (\mathbf{X}^{\top} \mathbf{A} \mathbf{X})^{-1} \mathbf{X}^{\top} \mathbf{A}) \end{split}$$

若 A 对称,则

$$\frac{\partial |\mathbf{X}^{\top} \mathbf{A} \mathbf{X}|}{\partial \mathbf{X}} = 2|\mathbf{X}^{\top} \mathbf{A} \mathbf{X}| (\mathbf{X}^{\top} \mathbf{A} \mathbf{X})^{-1} \mathbf{X}^{\top} \mathbf{A}$$

• 若 X、A 是方阵,则其均可逆,于是

$$\frac{\partial |\mathbf{X}^{\top} \mathbf{A} \mathbf{X}|}{\partial \mathbf{X}} = 2|\mathbf{X}^{\top}||\mathbf{A}||\mathbf{X}|\mathbf{X}^{-1} \mathbf{A}^{-1} \mathbf{X}^{-\top} \mathbf{X}^{\top} \mathbf{A} = 2|\mathbf{X}|^{2}|\mathbf{A}|\mathbf{X}^{-1}$$

• 若 A = I, 则

$$\frac{\partial |\mathbf{X}^{\top}\mathbf{X}|}{\partial \mathbf{X}} = 2|\mathbf{X}^{\top}\mathbf{X}|(\mathbf{X}^{\top}\mathbf{X})^{-1}\mathbf{X}^{\top} = 2|\mathbf{X}^{\top}\mathbf{X}|\mathbf{X}^{\dagger}$$

以及

$$\frac{\partial \ln |\mathbf{X}^{\top} \mathbf{X}|}{\partial \mathbf{X}} = \frac{1}{|\mathbf{X}^{\top} \mathbf{X}|} \frac{\partial |\mathbf{X}^{\top} \mathbf{X}|}{\partial \mathbf{X}} = 2\mathbf{X}^{\dagger}$$
